SUMMARY

Full-stack engineer with production experience in .NET, Java, Python, and React/Vue/TypeScript, plus independently shipped AI/ML work. **Open to relocation across Canada.**

EXPERIENCE

IT Developer Intern

MHI R.J Aviation

May 2025 – Present

Boisbriand, QC, Canada

- Eliminated manual repository monitoring for engineering leadership by building a real-time **React 19 / TypeScript** dashboard aggregating **20+ Azure DevOps** repositories into a single view, secured via **Azure AD / MSAL** with role-based access control.
- Closed a critical audit traceability gap in MHI's **Transport Canada**-regulated supplier **ERP** by delivering a net-new compliance module end-to-end in **C# / .NET**, supporting **100+** quality inspectors across **500+** global aerospace suppliers.
- Diagnosed and resolved a recurring indexing failure in a **1.7 million**-record document management system utilizing **Azure Cognitive Search** and **SQL** where newly onboarded organizations lost document retrieval access, tracing the root cause through free-form trigger analysis and iterative testing with no existing playbook to follow.
- Kept mission-critical aviation systems continuously operational by maintaining a multi-release deployment cycle across legacy **Windows Forms** and modern **ASP.NET MVC** codebases, driving features from requirements through QA and production hotfixes.

Full-Stack Developer

BG Communications International

September 2024 – April 2025

Montreal, QC, Canada

- Untangled and migrated a problematic legacy **SQL** schema to a normalized relational model, writing custom transformation scripts to move historical payroll and financial records without losing data integrity across a non-trivial structural overhaul.
- Built the full replacement system from the ground up: a **Java / Spring Boot** backend containerized with **Docker** and a **Vue.js** frontend, modernizing a desktop-bound payroll platform into a deployable web application.
- Covered critical payroll and business logic with automated end-to-end **Selenium** test suites in **Python** and structural **JUnit** unit tests, ensuring correctness before each release on a system handling real financial records.

EDUCATION

Concordia University

B.Eng. in Software Engineering

Montreal, QC, Canada

September 2021 – October 2025

- **Relevant coursework:** Data Structures and Algorithms, Artificial Intelligence, Big Data Analytics, Software Testing

PROJECTS

EPL Match Outcome Predictor | *Python, scikit-learn, FastAPI, Docker, GitHub Actions, Render, Netlify* | Personal Project

- Built a self-sustaining **MLOps** pipeline that ingests **4,180** real Premier League matches across **11 seasons**, engineers **30** rolling features, trains and calibrates a **HistGradientBoostingClassifier**, and serves live predictions via a **FastAPI** REST API, designed to run indefinitely without manual intervention.
- Achieved **45.3%** accuracy on a fully held-out **2025–26** validation season with calibrated probability outputs, beating the home-win baseline and exposing real predictive signal from form, **xG** differentials, and head-to-head history.
- Automated the full retraining and deployment cycle via **GitHub Actions**: pulls fresh fixtures twice a week, retrains the model, pushes updated binaries to Git, and triggers a zero-downtime **Render** redeploy, ensuring the system updates itself every matchweek.

Real-Time Emotion Recognition App | *PyTorch, ONNX, Flask, Render, Netlify* | Introduction to AI

- Designed and trained a 3-layer **CNN** from scratch on **35,000+ FER2013** images, evaluating **3 model variants** against macro/micro **F1** and selecting the best-performing architecture without pretrained weights or transfer learning.
- Revisited the project a year after submission and independently built a full production deployment around it, wrapping the model in a **Flask** API and shipping a live frontend on Netlify with no external direction or deadline.
- Reduced the production runtime footprint by **90%** from **~500MB** to **50MB** by exporting the trained **PyTorch** model to **ONNX** format, enabling lightweight inference on a live deployment that has served real users since launch.

SKILLS

Languages: C#, SQL, TypeScript, JavaScript, Python, Java, HTML/CSS

Frameworks: ASP.NET MVC, .NET, ADO.NET, Windows Forms, React.js, Spring Boot, Vue.js, Next.js, FastAPI, scikit-learn, pandas, Selenium, Tailwind CSS

Cloud & Platforms: Azure (Blob Storage, Key Vault, Active Directory, Cognitive Search, DevOps), Docker, Render, Netlify, Firebase, MSAL

Developer Tools: SSMS, Azure Storage Explorer, Git, GitHub Actions, JIRA, Confluence, VS Code, Visual Studio Enterprise, IntelliJ IDEA

Testing: Jest, React Testing Library, JUnit, Selenium (Python), end-to-end test automation

Methodologies: Agile, Scrum, CI/CD, MLOps
